Problem Statement:

One of the reputed FMCG Organization has 2 plants at 2 different locations which produces 50000 quantity of Noodles packaged per batch. Allowable lead level in each noodle package ranging from 0.001 to 2.5

However lots of customers complained that the lead is greater than allowable limits.

In order to satisfy the customers and to form a standard Q&A process for every batch now onwards company has decided to pick random 25 samples per batch for testing purpose.

Is there sufficient evidence at the 5% level of significance to support the claim that the lead level in each package is within the allowable limits?
